

Huoi Nam Khiao Ranger Stat. (1)

21/11/98

(R.S. = 47P 0506429  
1702758)

Tk011 - 47P 0506574  
1702926

cave is formed on steeply inclined bedding + mineral veins.

basically one large chamber (dry fossil phreatic) with small passages leading off, none of which are very long. Most of the chamber is filled with daylight from 4 entrances.

speleothems include 'serrated' curtains, <sup>encrustations in each entrance</sup> & the usual fauna - *Hippodamia* (*larratus*?) - 2

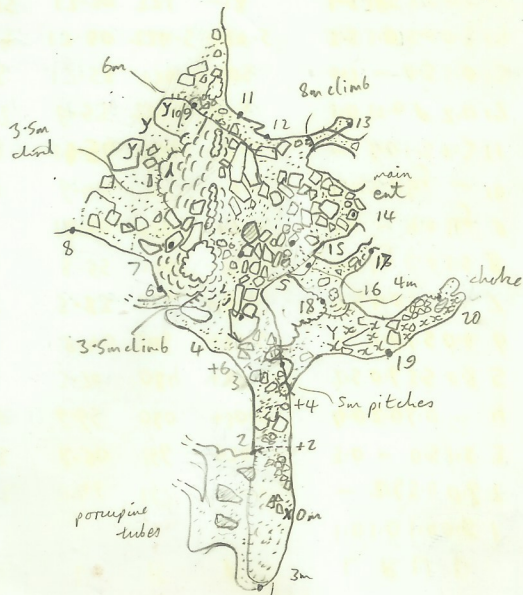

*Rhinolophus*? - 10 (small)

one large rat - grey, white underneath, v. long tail.

crickets, hairy moths, spiders, glyptothrips, harvestmen, porcupines, <sup>hundreds of</sup> small white, long legged spiders.

Evidence of guano extraction + removal of old soils, sediments, no fossils seen, voids in the sed. are lined with crystals, prob. calcite, maybe unusual due to amount of guano in the sed. highlights - possible unusual minerals in sediments.
